

15.7: Maximum/Minimum Problems

Example. Consider the function $f(x) = x^3 - 3x + 1$ on the interval $[-1, 2]$. Find the local extrema and absolute extrema of this function.

Definition. (Local Maximum/Minimum Values)

Suppose (a, b) is a point in a region R on which f is defined.

- If $f(x, y) \leq f(a, b)$ for all (x, y) in the domain of f and in some open disk centered at (a, b) , then $f(a, b)$ is a **local maximum value** of f .
- If $f(x, y) \geq f(a, b)$ for all (x, y) in the domain of f and in some open disk centered at (a, b) , then $f(a, b)$ is a **local minimum value** of f .
- Local maximum and local minimum values are also called **local extreme values** or **local extrema**.

Theorem 15.14: Derivatives and Local Maximum/Minimum Values

If f has a local maximum or minimum value at (a, b) and the partial derivatives f_x and f_y exist at (a, b) , then $f_x(a, b) = f_y(a, b) = 0$.

Definition. (Critical Point)

An interior point (a, b) in the domain of f is a **critical point** of f if either

1. $f_x(a, b) = f_y(a, b) = 0$, or
2. at least one of the partial derivatives f_x and f_y does not exist at (a, b) .

Example. Find the critical points of $f(x, y) = 3(x - 1)^2 + 4(2 - y)^3$.

Example. Find the critical points of $g(x, y) = x^2 + xy - y^2$.

Example. Find the critical points of $h(x, y) = \frac{3}{x} - \frac{4}{y}$.

Definition. (Saddle Point)

Consider a function f that is differentiable at a critical point (a, b) . Then f has a **saddle point** at (a, b) if, in every open disk centered at (a, b) , there are points (x, y) for which $f(x, y) > f(a, b)$ and points for which $f(x, y) < f(a, b)$.

Example. Compute the first and second order partial derivatives of $f(x, y) = x^2 - y^2$.

**Theorem 15.15: Second Derivative Test**

Suppose the second partial derivatives of f are continuous throughout an open disk centered at the point (a, b) , where $f_x(a, b) = f_y(a, b) = 0$. Let

$$D(x, y) = f_{xx}(x, y)f_{yy}(x, y) - (f_{xy}(x, y))^2.$$

1. If $D(a, b) > 0$ and $f_{xx}(a, b) < 0$, then f has a local maximum value at (a, b) .
2. If $D(a, b) > 0$ and $f_{xx}(a, b) > 0$, then f has a local minimum value at (a, b) .
3. If $D(a, b) < 0$, then f has a saddle point at (a, b) .
4. If $D(a, b) = 0$, then the test is inconclusive.

Example. Use the Second Derivative Test to classify the critical points of $f(x, y) = x^2 + 2y^2 - 4x + 4y + 6$.

Example. Use the Second Derivative Test to classify the critical points of $f(x, y) = xy(x - 2)(y + 3)$.

Definition. (Absolute Maximum/Minimum Values)

Let f be defined on a set R in \mathbb{R}^2 containing the point (a, b) .

- If $f(a, b) \geq f(x, y)$ for every (x, y) in R , then $f(a, b)$ is an **absolute maximum value** of f on R .
- If $f(a, b) \leq f(x, y)$ for every (x, y) in R , then $f(a, b)$ is an **absolute minimum value** of f on R .

Procedure:**Finding Absolute Maximum/Minimum Values on Closed Bounded Sets**

Let f be continuous on a closed bounded set R in \mathbb{R}^2 . To find the absolute maximum and minimum values of f on R :

1. Determine the values of f at all critical points in R .
2. Find the maximum and minimum values of f on the boundary of R .
3. The greatest function value found in Steps 1 and 2 is the absolute maximum value of f on R , and the least function value found in Steps 1 and 2 is the absolute minimum value of f on R .

Example. Find the absolute maximum and minimum values of $f(x, y) = xy - 8x - y^2 + 12y + 160$ over the triangular region $R = \{(x, y) : 0 \leq x \leq 15, 0 \leq y \leq 15 - x\}$.

Example. A shipping company handles rectangular boxes provided the sum of the length, width, and height of the box does not exceed 96 in. Find the dimensions of the box that meets this condition and has the largest volume.

Example. Find the absolute maximum and minimum values of $f(x, y) = 4 - x^2 - y^2$ on the open disk $R = \{(x, y) : x^2 + y^2 < 1\}$ (if they exist).

Example. Find the point(s) on the plane $x + 2y + z = 2$ closest to the point $P(2, 0, 4)$.
