## 11.1: Approximating Functions with Polynomials

A power series is an infinite series of the form

$$\sum_{k=0}^{\infty} c_k (x-a)^k = \underbrace{c_0 + c_1 (x-a) + c_2 (x-a)^2 + \dots + c_n (x-a)^n}_{\text{nth-degree polynomial}} + c_{n-1} (x-a)^{n-1} + \dots,$$

**Example.** The tangent line of a function f(x) at x = a is a linear function  $p_1(x)$  that can approximate f(x) for values of x 'close' to a:

$$p_1(x) = f(a) + f'(a)(x - a)$$

Find a quadratic function  $p_2(x)$  that can approximate f(x) near x = a,

Find a cubic function  $p_2(x)$  that can approximate f(x) near x = a,

Find an *n*th degree polynomial  $p_n(x)$  that can approximate f(x) near x = a.

## Definition. (Taylor Polynomials)

Let f be a function with  $f', f'', \ldots$ , and  $f^{(n)}$  defined at a. The nth-order Taylor polynomial for f with its center at a, denoted  $p_n$ , has the property that it matches f in value, slope, and all derivatives up to the nth derivative at a; that is,

$$p_n(a) = f(a), p'_n(a) = f'(a), \dots, \text{ and } p_n^{(n)}(a) = f^{(n)}(a).$$

The nth-order Taylor polynomial centered at a is

$$p_n(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \dots + \frac{f^{(n)}(a)}{n!}(x - a)^n$$

More compactly,  $p_n(x) = \sum_{k=0}^{\infty} c_k (x-a)^k$ , where the **coefficients** are

$$c_k = \frac{f^{(k)}(a)}{k!}, \quad \text{for } k = 0, 1, 2, \dots, n.$$

**Example** (LC 26.1). Suppose f(4) = 3, f'(4) = -1, f''(4) = 6, and  $f^{(3)}(4) = 16$ . Find the third-order Taylor polynomial  $p_3(x)$  for f centered at a = 4.

**Example** (LC 26.2). For the following functions, find  $p_2(x)$ , the 2nd degree Taylor polynomial, centered at a = 0.

$$y = \sqrt{1 + 2x}$$

$$y = \frac{1}{\sqrt{1+2x}}$$

$$y = \frac{1}{1 + 2x}$$

$$y = \frac{1}{(1+2x)^3}$$

$$y = e^{2x}$$

$$y = e^{-2x}$$

# Definition. (Remainder in a Taylor Polynomial)

Let  $p_n$  be the Taylor polynomial of order n for f. The **remainder** in using  $p_n$  to approximate f at the point x is

$$R_n(x) = f(x) - p_n(x).$$

## Theorem 11.1: Taylor's Theorem (Remainder Theorem)

Let f have continuous derivatives up to  $f^{(n+1)}$  on an open interval I containing a. For all x in I,

$$f(x) = p_n(x) + R_n(x),$$

where  $p_n$  is the nth-order Taylor polynomial for f centered at a and the remainder is

$$R_n(x) = \frac{f^{(n+1)}(c)}{(n+1)!} (x-a)^{n+1},$$

for some point c between x and a.

### Theorem 11.2: Estimate of the Remainder

Let n be a fixed positive integer. Suppose there exists a number M such that  $|f^{(n+1)}(c)| \leq M$ , for all c between a and x inclusive. The remainder in the nth-order Taylor polynomial for f centered at a satisfies

$$|R_n(x)| = |f(x) - p_n(x)| \le M \frac{|x - a|^{n+1}}{(n+1)!}.$$

**Example** (LC 27.1-27.2). The third-order Taylor polynomial centered at a=1 for  $f(x)=x\ln(x)$  is

$$p_3(x) = (x-1) + \frac{(x-1)^2}{2} - \frac{(x-1)^3}{6}.$$

Find the smallest number M such that  $|f^{(4)}(x)| \leq M$  for  $\frac{1}{2} \leq x \leq \frac{3}{2}$ .

Compute the upper bound for  $|R_3(x)|$ .

Example (LC 27.3-27.5). Consider  $f(x) = e^x$ .

Find the Taylor polynomial  $p_4(x)$  centered at a = 0.

What is the smallest integer M such that  $|f^{(5)}(x)| \leq M$  for  $0 \leq x \leq 1/4$ ?

Compute the upper bound for  $|R_4(x)|$  when  $p_4(x)$  is used to compute  $e^{1/4}$ .

**Example** (LC 27.6-27.7). We want to approximate  $\sin(0.2)$  with an absolute error no greater than  $10^{-3}$  by using a *n*th degree Taylor polynomial for  $f(x) = \sin(x)$  centered at a = 0. We want to determine the minimum order of the Taylor polynomial that is required to meet this condition.

What is the smallest integer number M that bounds  $f^{(n+1)}(x)$  on  $0 \le x \le 0.2$ ?

Apply Taylor's Estimate of the Remainder Theorem to find the minimum value of n such that  $|R_n(x)| \leq \frac{1}{10^3}$ .
